Jacki and Kyle,

Just wanted to give you a heads up...I forwarded the email to Jim Semerad also to keep the State in the loop on concerns.

Jacki,

I would like to come visit on Thursday, around 4:00 pm. Does this work for your schedule?

Tricia Rios Pfeiffer, Engineer
U.S. Environmental Protection Agency-Region8

It's great that you are keeping track of odors, truck traffic, and wind direction. Diesel fumes are certainly a pollutant, the EPA (through the states) dedicates millions of dollars a year to retrofit and replace older, high-emission vehicles with cleaner alternatives. This program is voluntary, so the companies that own the heavy duty diesel fleets have to want to take part. We give money to the North Dakota Dept. of Health- Air Quality division, and in the past they have worked mostly on school buses. Perhaps with all the oil development they will begin working with oil companies, but it's up to the state to determine how to use the funds.

Subject: Oasis ESE

I wonder if the gas problems for the past month or longer were coming from the Oasis site to the SE of me-there is a frack job in the process right now on this well-it is at least 5 miles away from us and yet the air today is horrid and the wind is from the SE. The smell of DIESEL in the air is so bad your eyes burn and I can smell it. I have a very poor ability to smell due to all the gas I have been exposed to over the past 2 years-so when I can smell something it must be very strong. It is also very alarming that these gases travel this far of a distance from the site. Right now this is the only activity around me other than normal operations of well sites. This frack job started about last Friday, I realized that it is was in the process when hundreds of trucks were running up and down the road in front of my house over the weekend. This job is actually far enough from my house that I cannot see the crane and site- I followed the trucks to see where they were going.
